# **1** Preface

The OpenStreetMap (OSM) project (www.openstreetmap.org) has collected an enormous amount of free spatial data and the database is growing every day. Many people want to use this data for their own GIS projects but have been hindered by the use of a non-standard data format in the OSM project. This document describes a mapping from OSM data formats to the usual GIS formats to make the OSM data accessible to more people.

The mapping from OSM data to other formats is not an exact science. OSM rules on how to map certain features are often not well defined and there is no mandatory quality control. This openness allows a lot of flexibility and is part of the reason why OSM has been able to collect so much data in such a short time frame, but it makes using the data more difficult. When using or exporting the data, many decisions have to be made on how to extract the different features into something usable for the task at hand.

The mapping described in this document is in no way the only mapping possible, in fact there is an infinite number of possible mappings. In this document we have specified a general-use mapping of the basic features like roads, waterways, different land use types, and points of interest. Other uses might need specialized mappings, but they are out of the

#### scope of this document.

The format described in this document is used by Geofabrik to create shapefiles which are offered for free download from download.geofabrik.de.

# 2 Introduction

### 2.1 Versions

The commercially available shape files from Geofabrik carry a version identifier in each layer name. The free shapes contain the name "free" in each layer name to distinguish them.

### 2.2 Map datum

All coordinates are unprojected WGS84 (EPSG:4326).

### 2.3 Character encoding

All strings are encoded in UTF-8.

#### 2.4 Attribute names

All attribute names are lower case and are less than 11 characters long so that they are not truncated in shapefiles.

## 2.5 Common attributes

Attribute	PostGIS Type	Description
id	VARCHAR (4 Bytes)	Id of this feature. Unique in this layer.
osm_id	VARCHAR (10)	OSM Id taken from the Id of this feature (node_id, way_id, or relation_id) in the OSM database. In case several features in the OSM database are joined into one feature, this is one of the Ids. This Id is not necessarily unique because one OSM object can result in several geometry objects. Also note that when doing shape file exports, this will be exported as a VARCHAR type since shape files don't support long integers.
code	SMALLINT (2 Bytes)	4 digit code (between 1000 and 9999) defining the feature class. The first one or two digits define the layer, the last two or three digits the class inside a layer.
fclass	VARCHAR(40)	Class name of this feature. This does not add any information that is not already in the "code" field but it is better readable.
name	VARCHAR(100)	Name of this feature, like a street or place name. If the name in OSM contains obviously wrong data such as "fixme" or "none", it will be empty.

The code and the combination of layer name and fclass always contains the same information.

#### 2.6 International Names

In OpenStreetMap, every feature can have many names. The standard name is always the name used on the ground, locally, usually the name as it would be written on a sign. There may be any number of additional names in different languages, plus also a specific "international name". In cases where the local script is not latin script, the international name will often contain a transcribed version of the standard name.

By default, Geofabrik shape files will always carry the standard name, the one that is given in OSM's "name" tag. If you need additional name (e.g. international name or names in a specific language), that can be arranged in the paid shape service – please contact us.

### 2.7 Layers

In OSM there are no layers in the traditional GIS sense. All features are in one big coherent database.

For the purpose of the mapping described in this document, the features stored in the OSM database are extracted into different layers depending on their type.

All layers defined in this document use the "osm\_" prefix for their names.

### 2.8 Points and Areas

The availability of high-resolution aerial imagery has led to many POI features being recorded as areas (building or site outlines), not points, in OpenStreetMap. You will, for example, often find a restaurant or hotel drawn as an area. Features drawn as area in OpenStreetMap will be written to the layer with an \_a suffix. Features drawn als line/point in OpenStreetMap will be written to the layer without an \_a suffix.

## 2.9 Spillover Shape Files

When a certain layer becomes too large for one shape file (shape files are limited to 2 GB in size), it will automatically spill over into additional shape files. A shape file named "osm\_pois\_v07\_1.shp" will have spillover shape files names "osm\_pois\_v07\_2.shp", "osm\_pois\_v07\_3.shp" and so on.

# 7 Differences to Commercial "0.7" Shape Files

Geofabrik offers an extended version of these shapes, for arbitrary areas, commercially. These 0.7 files contain the following extensions compared to the free files:

### 7.1 Associated Area Layer

As described in section 2.8, some features are drawn at OpenStreetMap sometimes as area and sometimes as points. Geofabrik's paid shape files contain centroids of the areas if a feature class exists both as area and as point.
